

Salesforce Residential Real Estate

Pre-Discovery Developer Plan

Developer perspective • Understanding the assignment • Discovery questions • Technical risks •
Areas to validate before build

Purpose

Demonstrate that the end-to-end business journey is understood, identify the questions that can materially affect the Salesforce design, and surface technical risks without prematurely locking the solution.

Pre-discovery principle

Do not treat open questions as final requirements. Use this document to guide business, CRM, Finance, SAP, Legal/Compliance and integration discussions. Final alignment happens during detailed discovery and pre-production.

1. How to Position Yourself in the Meeting

Suggested opening:

"I've gone through the BRN from an implementation perspective and tried to understand the end-to-end lifecycle, the Salesforce touchpoints, and especially the areas where we need business clarification before development. I have observations and questions around data ownership, KYC, inventory locking, integrations, document lifecycle, payments and post-booking processes. I haven't treated these as final requirements; I see them as discovery questions that we can validate with the business."

Your objective:

- Show that you understand the business journey, not just individual BRN rows.
- Identify assumptions that could materially change the data model or automation.
- Surface integration, security, concurrency and data-quality risks early.
- Ask questions without prematurely deciding the technical solution.
- Convert confirmed business decisions into technical design during discovery/pre-production.

2. End-to-End Residential Real Estate Journey

Stage	Business journey
LEAD	Lead capture → Dedup → Assignment → Qualification
SITE VISIT	Schedule → OTP/verification → Conduct → Feedback → Follow-up
OPPORTUNITY	Unit matching → Unit selection → Cost sheet → Negotiation → Payment plan
BOOKING	Application → KYC → Documents → Payment → Verification → Approval → Unit block
SAP / FINANCE	Customer Master → Sales Order → Demand → Collection → Receipt → Reconciliation
POST-BOOKING	Agreement → Registration → Inspection → Possession / Handover
EXCEPTIONS	Cancellation → Transfer → Unit Shift → Resale / Assignment

Supporting systems/processes:

- Website / Web-to-Lead and property portals
- Facebook / Google / campaign sources
- CTI / telephony
- Digio / DigiDocs / e-sign and document generation
- Payment gateway
- SAP ERP
- Experience Cloud / customer-facing forms
- Reports and dashboards

3. Actor / Responsibility Map

Actor	Likely Salesforce touchpoint / responsibility
Customer	Lead details, site visit, application, KYC, payment, agreements
Pre-Sales	Lead qualification, nurturing, site visit scheduling
Sales Executive	Opportunity, unit selection, negotiation, booking progression
Reception / GRE	Walk-ins, lead creation, site-visit handling
Tower Incharge / CRM	Applicant, family, bank and KYC information; booking processing
CRM Manager	Booking approval, document/completeness review
Finance	Payments, receipts, reconciliation, refunds, financial review
Marketing	Lead sources, campaign tagging, project/unit media
SAP Team	Customer master, sales order, inventory/financial system-of-record areas
External Vendors	CTI, document/e-sign, payment and other integrations

4. Key Discovery Area — Customer & KYC

The BRN already includes KYC collection/verification and applicant information, but the exact KYC lifecycle and verification rules need to be validated. ■filecite■turn3file6■L85-L88■

Questions to raise:

- What exactly constitutes KYC for Primary Applicant, Co-applicant, Nominee, Channel Partner and Resale Customer?
- Which documents are mandatory for each customer/applicant type?
- Are we only collecting documents, or performing identity verification?
- Who verifies KYC — Sales, CRM, Compliance, Finance or an external provider?
- At what stage does KYC become a hard prerequisite: token, application, unit block, booking, SAP customer creation, agreement or registration?
- What happens when a document is rejected? Can the customer resubmit?
- Do documents expire or require revalidation?
- Do we need a full audit trail of upload, reviewer, verification date, rejection reason and resubmission?
- What PAN/Aadhaar data are we permitted/required to persist in Salesforce, and what should remain with an external KYC provider?

Developer implication to validate: KYC may need its own lifecycle/status and relationship to applicants rather than being treated as a loose collection of Files.

5. Applicant / Co-Applicant Data Model Questions

The BRN proposes Booking Applicants as a junction between Contact and Booking and supports multiple applicants. ■filecite■turn3file6■L85-L86■

- Can the same person participate in multiple bookings?
- Can a person be Primary Applicant on one booking and Co-applicant on another?
- What is the maximum number of applicants?
- Are nominee and family member separate roles/entities?
- Which information belongs to the person versus the applicant's role in a specific booking?
- Which applicant receives documents, demands and communications?
- Can applicant roles change after booking?

6. Inventory — Major Technical Risk Area

The hierarchy is Project → Tower → Floor → Unit, with SAP described as the source of truth for unit status and Salesforce participating in inventory processes. ■filecite■turn3file5■L74-L76■

Questions:

- What is the authoritative system for inventory availability at each stage?
- What is the difference between Available, Hold, Blocked and Sold?
- When exactly does a unit become unavailable to another salesperson?
- How long does a hold last? Is expiry automatic?
- Can CRM extend a hold?
- What happens if Salesforce says Available but SAP says Blocked?
- Who wins during an inventory conflict?
- What happens when SAP is unavailable during a booking attempt?
- How are cancellation, resale and unit-shift status transitions synchronized?

Concurrency scenario to discuss:

Salesperson A and Salesperson B both see Unit 101 as Available → both attempt to select/book it → Salesforce and SAP must prevent or resolve the conflict deterministically.

7. Pricing & Commercial Rules

Potential components include Base Price, Floor Rise, PLC, Parking, ad-hoc charges, taxes, discounts, payment plans and commission.

Ask for a System-of-Record decision for every component:

Component	Owner to confirm
Base price	Salesforce / SAP / other
Floor rise	Salesforce / SAP / other
PLC	Salesforce / SAP / other
Parking	Salesforce / SAP / other
Taxes	Salesforce / SAP / other
Discount	Salesforce / approval / SAP
Payment plan	Salesforce / SAP / other
Commission	Salesforce / finance / other

- Who owns the final commercial value?
- Is Salesforce calculating or displaying values mastered elsewhere?
- How is a pricing snapshot retained when a unit changes or a document is regenerated?
- What happens if Salesforce and SAP return different prices?
- Which values are editable by Sales, CRM and Finance?

8. Booking & Payment Architecture

The process connects payment plans, demands, receipts, approvals and SAP synchronization. The BRN includes partial/multiple receipts and Finance approval before receipt synchronization. ■filecite■turn3file8■L111-L112■

- Is Salesforce the financial system or primarily a visibility/workflow layer?

- Which system is authoritative for outstanding balance?
- Who calculates interest, GST and payment allocation?
- Can one payment be applied to multiple demands?
- How are partial payments handled?
- How are overpayments or unapplied credits handled?
- Can receipts be reversed/cancelled?
- How are bounced payments represented?
- Can Finance modify an allocation after SAP synchronization?
- How is a duplicate receipt prevented if an integration request is retried?

Key developer question: “What unique business key/idempotency mechanism prevents duplicate customer/order/receipt creation when integrations retry?”

9. Integration Discovery Checklist

For every external integration, capture the following before technical design:

Dimension	Questions
Direction	SF → external, external → SF, or bidirectional?
Trigger	Real-time, scheduled, batch, webhook, event?
Authentication	OAuth, Named Credential, API key, certificate?
Payload	What fields, formats, identifiers and mandatory values?
Response	What does success/failure return?
Retry	Automatic retry? Manual reprocess? Maximum attempts?
Idempotency	Which external/business key prevents duplicates?
Timeout	What happens when the external system does not respond?
Monitoring	Where do support/CRM users see failures?
Reconciliation	How do we detect records that diverged?
Ownership	Who owns integration support and credentials?

Known areas requiring discovery: SAP customer master, inventory/status, sales order, payment/receipt synchronization, CTI, document/e-sign and payment gateway. The BRN explicitly leaves several integration mechanisms and error-handling details for detailed discovery. ■filecite■turn3file8■L87-L88■

10. CTI Discovery

- Which CTI vendor and Salesforce integration approach?
- Inbound screen-pop and outbound click-to-call?
- Where are recordings stored, and what is stored in Salesforce?
- Recording retention and access rules?
- Call dispositions and RNR taxonomy?
- Callback scheduling and missed-call handling?
- Call masking requirements?
- Queue/routing rules by language, channel or contact reason?
- What happens when the caller's phone number matches multiple records?
- Do CTI webhooks require retry/idempotency handling?

- Is AI call summarization/quality monitoring in current scope or future phase?

Developer focus: define the Salesforce activity model and external call/recording identifier before automation is built.

11. Documents & E-Sign Lifecycle

Treat documents as a lifecycle, not simply “generate a PDF.”

Potential state	Questions
Draft	Who can create/edit?
Generated	Template/version?
Sent	To whom and through which channel?
Signed	Who signed and when?
Rejected / Failed	Can it be resent or regenerated?
Superseded	Do we retain previous versions?
Final	Where is the authoritative signed copy?

- Who owns each template?
- Do documents require Word as well as PDF?
- Do regenerated documents retain old versions?
- How are external e-sign envelope/document IDs stored?
- How are provider callbacks reconciled?
- Can a document be regenerated after it has already been sent for signature?
- Who can generate, regenerate, resend or share sensitive documents?

12. Security & Sharing

A key discovery question is not only “who can access the object?” but “who can see each category of data?”

Role	Example access to validate
Pre-Sales	Lead and site-visit information
Sales	Lead, Opportunity, selected unit and relevant booking information
CRM	Booking, applicant, KYC and operational information
Finance	Payments, receipts, financial reconciliation
Management	Aggregated operational/commercial reporting
Customer	Only their own permitted records/documents

- Do KYC documents require stricter access than normal Booking data?
- Should Sales retain access after Booking handover?
- Does CRM need record-level sharing or broader object access?
- Are Finance fields/documents restricted?
- Do customers need Experience Cloud access now or in a future phase?
- What audit/history is required for sensitive data?

The BRN anticipates sharing considerations around post-booking access and may require custom sharing logic; validate this before implementing ownership/automation assumptions.

13. Legal / RERA / Registration Questions

Legal/compliance should provide the authoritative rules; developers should capture them as requirements rather than interpret them.

- Which RERA/legal milestones must be represented in Salesforce?
- What is the required agreement/booking sequence?
- Are there legal prerequisites before accepting particular payments?
- What documents and declarations are mandatory at each stage?
- Who owns the legal approval?
- Which dates must be immutable/auditable?
- What registration information must be captured?
- Do stamp duty and registration charges need to be tracked separately?
- What happens when registration is delayed or revalidated?

The BRN includes registration/revalidation readiness checks involving KYC, payments, documents and inspection, so registration should be explicitly mapped during discovery. ■filecite■turn3file7■L98-L99■

14. Possession / Inspection / Handover

Potential journey to validate:

Project Ready → Final Demand → Payment Clearance → Inspection → Snagging/Defects? → NOC? → Possession → Handover

- Who initiates possession readiness?
- Is inspection a custom Salesforce process or another system?
- Are defects/snagging tracked in Salesforce?
- Are outstanding payments a hard blocker?
- Are NOCs required before handover?
- What documents are generated at possession?
- Who records possession date and handover confirmation?

15. Resale / Transfer / Unit Shift

The BRN contains separate resale/assignment, unit-shift and cancellation processes. Resale includes eligibility, approvals, KYC/onboarding, documents and SAP synchronization. ■filecite■turn3file7■L99-L103■

- Is resale a transfer of the existing Booking or a new commercial transaction linked to the old one?
- How do we maintain traceability from original customer → original booking → resale request → new customer?
- Which eligibility rules are configurable?
- Which approvals are required and by whom?
- Which original documents remain valid?
- Does the new customer repeat KYC?
- How are existing payments, demands and outstanding balances handled?
- Does a unit shift create a new price snapshot?
- Which financial adjustments remain manual in Finance/SAP?
- Which SAP references need to be returned to Salesforce?

16. Cancellation — State Management

Avoid reducing cancellation to a single status update.

Example lifecycle to validate: Active → Cancellation Requested → Under Review → Approved → Refund Processing → Refund Completed → Cancelled

- Who can initiate cancellation?
- What documents/reasons are mandatory?
- Who approves?
- When does the unit become available again?
- Does refund completion precede inventory release?
- How are cancellation charges calculated?
- Who calculates refund in Finance/SAP?
- How is refund status returned to Salesforce?
- Can a cancellation be rejected or withdrawn?

The BRN specifically connects unit reversion to cancellation/refund processing, making the exact state sequence important.

filecite turn3file9 L124-L124

17. Data Migration & Historical Data

Ask this early, even if migration is not yet in scope.

- Are existing Leads being migrated?
- Existing Customers / Person Accounts?
- Existing Bookings?
- Existing Units and inventory history?
- Existing demands and receipts?
- Existing agreements and documents?
- Existing SAP customer/order identifiers?
- Historical cancellations/transfers/resales?
- How will duplicates be cleaned before migration?
- What external IDs will be used?

18. Bulk, Scale & Automation Questions

- What processes can occur in bulk rather than one record at a time?
- Expected daily/monthly lead volume?
- Expected unit/inventory update volume from SAP?
- Expected booking/payment/receipt volumes?
- Could bulk SAP updates trigger Salesforce automation?
- Which processes may require asynchronous processing?
- Are API limits and Salesforce transaction limits part of the integration design?
- Do users need bulk reassignment, approval or document actions?

Developer lens: Design for business volume after discovery confirms it; do not assume every business transaction maps to one Salesforce transaction.

19. SLA / TAT Questions

- Does a 24-hour SLA mean calendar hours or business hours?
- Do weekends/holidays count?
- What timezone applies?
- When does the SLA clock start?
- When does it pause?
- When does it stop?
- What happens after SLA breach?
- Who receives escalation notifications?
- Do different lead sources/projects have different SLAs?

Small clarification, potentially large implementation impact.

20. Developer Risk Register — To Validate in Discovery

Risk area	What to validate
SAP ↔ Salesforce inventory	Concurrency, stale data, source of truth, retry and reconciliation
Unit blocking	Hold/block semantics, expiry and conflict handling
KYC / sensitive documents	Verification, retention, access, audit and permitted data
Payments	Partial payments, allocation, reversals, duplicate prevention
Pricing	Master ownership and pricing snapshots
Integration failures	Retry, timeout, idempotency and monitoring
Sharing	Sales/CRM/Finance access and post-booking visibility
Documents	Versioning, regeneration, e-sign lifecycle
Data migration	Duplicates, external IDs, historical relationships
Scale	Bulk volume, asynchronous processing, API limits

21. System-of-Record Matrix

Use this as a discovery workshop artifact. Do not fill it with assumptions.

Data domain	Salesforce	SAP	External / Other
Lead	Confirm	—	Confirm
Customer Master	Confirm	Confirm	—
Project / Tower / Floor / Unit	Confirm	Confirm	—
Unit Status	Confirm	Confirm	—
Pricing	Confirm	Confirm	Confirm
Payment Plan	Confirm	Confirm	Confirm
Demand	Confirm	Confirm	—
Receipt	Confirm	Confirm	Payment system?
Customer Code	Confirm	Confirm	—
Sales Order	Confirm	Confirm	—
KYC	Confirm	Confirm?	KYC provider?
Documents	Confirm	Confirm?	Digio/DigiDocs?

Data domain	Salesforce	SAP	External / Other
Call Recording	Reference/link	—	CTI

Goal: every important data element should have one clearly understood owner, even if Salesforce stores a synchronized copy.

22. Recommended Pre-Discovery Deliverables

Deliverable	Purpose
1. End-to-end process map	Show understanding of the business journey
2. Actor map	Clarify who performs each step
3. System map	Show Salesforce ↔ SAP ↔ external systems
4. Open-question register	Track decisions needed from business
5. System-of-record matrix	Clarify data ownership
6. Technical risk register	Surface concurrency, integration and security risks
7. Data-model candidates	Identify entities/relationships without locking design
8. Discovery decision log	Record confirmed decisions and rejected assumptions

23. Suggested 7-Slide Team Deck

- **Slide 1 — My understanding:** Residential Real Estate — End-to-End Salesforce Journey
- **Slide 2 — Process Flow:** Lead → Site Visit → Opportunity → Unit → Booking → SAP → Collection → Agreement → Possession
- **Slide 3 — Salesforce / External Systems:** Salesforce ↔ SAP ↔ CTI / Digio / DigiDocs / Payment / Portals
- **Slide 4 — Key Discovery Questions:** KYC / Inventory / Pricing / Payments / Documents / Security
- **Slide 5 — Technical Risks:** Concurrency / Integration failures / Idempotency / Sharing / Data quality
- **Slide 6 — Data Ownership:** Salesforce vs SAP vs external systems
- **Slide 7 — Next Step:** Business confirmation → Detailed discovery → Data model → Integration design → Technical design → Build

24. Suggested Closing Statement

“I’m treating these as pre-discovery questions rather than assumptions. Once the business confirms them, we can translate the decisions into the actual object model, automation, Apex, integration and security design during discovery and pre-production.”

Mindset: Think ahead technically, but don’t prematurely lock the solution.

Source & scope note

This document incorporates the supplied BRN/training material and the developer-oriented discovery plan discussed in this conversation. BRN-specific statements are retained as assumptions/questions where the source says they require detailed discovery. External context is used only to flag areas such as KYC/legal compliance for validation with the appropriate business/compliance owners; it is not a substitute for their final requirements.
